

22. Adult tapeworms live in the intestine of foxes. Their eggs are passed out in the foxes' waste and survive on the grass for months. The eggs infect rabbits eating the grass and the tapeworms complete their lifecycle inside the rabbits' bodies. Foxes, which prey on the rabbits, are then infected.

Which row in the table identifies the roles of the fox, tapeworm egg and rabbit?

	Fox	Tapeworm egg	Rabbit
A	host	resistant stage	intermediate host
B	host	vector	intermediate host
C	intermediate host	vector	host
D	intermediate host	resistant stage	vector
