

17. The effect of concentration of disinfectant on survival of bacteria was investigated.

Cultures of bacteria were grown in media containing different concentrations of disinfectant and the number of bacteria surviving in each culture was recorded every 10 minutes for 50 minutes.

The results are shown in the graph.

Which statement is supported by the data?

- A 1% disinfectant kills all bacteria twice as fast as 0.5%.
- B At 20 minutes 0.1% disinfectant kills more bacteria than 0.5% disinfectant.
- C As concentration of disinfectant increases the length of time taken to kill all bacteria increases.
- D As concentration of disinfectant increases the length of time taken to kill all bacteria decreases.
