

10. Succinate dehydrogenase is an enzyme that catalyses a reaction in the citric acid cycle as shown in the diagram.

Malonate is a competitive inhibitor of succinate dehydrogenase.

Which statement about succinate dehydrogenase is correct?

- A Succinate and malonate have a higher affinity than fumarate for the active site of succinate dehydrogenase.
- B Increasing the concentration of fumarate would reverse the inhibition of succinate dehydrogenase.
- C Increasing the concentration of succinate would have no effect on the inhibition of succinate dehydrogenase.
- D Malonate and succinate bind to different sites on succinate dehydrogenase.
