What is the component of weight acting **down a slope** inclined at angle θ ?

 **Key Concept:**

The component of weight down a slope is:

$$W \sin \theta = mg \sin \theta$$

 **Final Answer: C** — $mg \sin \theta$

 **Revision Tips:**

- Down the slope: $mg \sin \theta$
- Normal to slope: $mg \cos \theta$
- These components are used in motion on inclines.
