Section: Particles and Waves

Topic: Wave-Particle Duality

A beam of electrons behaves like a wave in an experiment.

Which property provides evidence of wave behaviour?

- A. Reflection
- B. Refraction
- C. Diffraction
- D. Absorption

Solution:

Diffraction is a wave phenomenon — electrons diffracting shows they behave like waves.

Answer: C

Revision Tip:

Wave behaviour is shown by **interference** and **diffraction**. Particle behaviour shows up in collisions or photoelectric effect.
