

2021-Ph-H1-Q16

Section: Particles and Waves

Topic: Wave-Particle Duality

Which property of light demonstrates **wave-particle duality**?

Solution:

Interference = wave behaviour

Photoelectric effect = particle behaviour

So **both must be observed** to show duality.

Answer: B

Guidance for Students:

Duality means light acts **sometimes like a wave**, sometimes like a particle. You need to observe both types of evidence.

Revision Tip:

Waves = interference, diffraction

Particles = photoelectric effect

Know the examples of each!
